# 1 Fibonacci Series

## 1.1 Aim

- Write a program to print the first n terms of the Fibonacci series

## 1.2 Code

---

```
package org.projects.prog1;
import java.util.Scanner;

public class Fibo {
    public static void main(String args[]) {
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number of terms");
        int limit = sc.nextInt();

        for (int i = 0; i < limit; i++) {
            System.out.print(fibo(i) + " ");
        }
    }

    static int fibo(int num) {
        return (num <= 1)? num : fibo(num - 1) + fibo (num - 2);
    }
}
```

---

## 1.3 Output

## 2 Operations On Complex Numbers

### 2.1 Aim

- Write a program to create a class Complex to store complex numbers
- Complex has two fields to store the real and imaginary parts
- create static functions to add and multiply two complex numbers
- create a member function to display the complex number

### 2.2 Code

---

```
package org.projects.prog2;
import java.util.Scanner;

public class Complex {
    int real, img;

    Complex(int real, int img) {
        this.real = real;
        this.img = img;
    }

    void display() {
        // some formatting to correctly display complex numbers
        String fmt = String.format(
            "%d %c %di",
            real,
            (img > 0)? '+' : '-',
            (img > 0)? img : (-1 * img)
        );

        System.out.println(fmt);
    }

    static Complex add(Complex n1, Complex n2) {
        return new Complex(n1.real + n2.real, n1.img + n2.img);
    }

    static Complex multiply(Complex n1, Complex n2) {
        // alg
        // (a + bi) * (c + di)
        // = ac + adi + bci - bd =
        // = (ac - bd) + (ad + bc)i
        int real = n1.real * n2.real - (n1.img * n2.img);
        int img = (n1.real * n2.img) + (n1.img * n2.real);
        return new Complex(real, img);
    }

    static void cmp(Complex n1, Complex n2) {
        if (n1.real == n2.real && n1.img == n2.img) {
            System.out.println("The complex numbers are equal");
        } else {
            System.out.println("The complex numbers are not equal");
        }
    }

    public static void main(String args[]) {
        Complex
```

```
    c1 = new Complex(2, 3),
    c2 = new Complex(1, -2),
    c3 = add(c1, c2),
    c4 = multiply(c1, c2);

    c1.display();
    c2.display();
    c3.display();
    c4.display();

    cmp(c1, c2);
    cmp(c1, c1);
}
}
```

---

## 2.3 Output

- 3 Package Implementation
- 4 Class Implementation
- 5 Abstract Class Implementation
- 6 Inheritance In Java
- 7 Abstract Class With Inheritance
- 8 Interface Implementation
- 9 Multithreading In Java
- 10 Exception Handling

## 11 Validation using Swing

### 11.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 11.2 Code

---

```
package org.projects.prog11;
import java.awt.GridLayout;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;

import javax.swing.*;

//11. Write a swing program for validating the form having a numeric field,
//character field, phone number, and email ID.

public class Swing {
    public static void main(String[] args) {
        JFrame frame = new JFrame("Swing Example");
        frame.setLayout(new GridLayout(3, 2));
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setSize(300, 130);

        JTextField phoneNum = new JTextField();
        frame.add(new JLabel("Phone"));
        frame.add(phoneNum);

        JTextField email = new JTextField();
        frame.add(new JLabel("Email"));
        frame.add(email);

        JButton submit = new JButton("Submit");
        JLabel result = new JLabel();
        result.setHorizontalAlignment(JLabel.CENTER);

        submit.addActionListener( new ActionListener() {
            public void actionPerformed(ActionEvent e) {
                String em = email.getText();
                String phone = phoneNum.getText();
                result.setText("invalid");

                if (em.isEmpty() || phone.isEmpty()) { return; }

                try {
                    Long.parseLong(phone);
                    if (phone.length() < 10) { return; }
                } catch (Exception error) { return; }

                if (!em.contains("@")) { return; }

                result.setText("Valid");
            }
        });
    }
}
```

```
    frame.add(submit);  
    frame.add(result);  
    frame.setVisible(true);  
}  
}
```

---

### 11.3 Output

## 12 Text Field in Swing

### 12.1 Aim

- Create a Swing program that accepts a number
- if the number is even add it to list1
- else add it to list 2

### 12.2 Code

---

```
package org.projects.prog12;
import java.awt.GridLayout;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;

import javax.swing.*;

public class Swing {
    public static void main(String[] args) {
        JFrame frame = new JFrame("Swing Example");
        frame.setLayout(new GridLayout(4, 2));
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setSize(300, 130);

        JTextField number = new JTextField();
        frame.add(new JLabel("Number: "));
        frame.add(number);

        JLabel list1 = new JLabel();
        list1.setHorizontalAlignment(JLabel.CENTER);
        frame.add(new JLabel("List 1"));
        frame.add(list1);

        JLabel list2 = new JLabel();
        list2.setHorizontalAlignment(JLabel.CENTER);
        frame.add(new JLabel("List 2"));
        frame.add(list2);

        JButton submit = new JButton("Submit");

        submit.addActionListener( new ActionListener() {
            public void actionPerformed(ActionEvent e) throws NumberFormatException {
                int num = Integer.parseInt(number.getText());
                number.setText("");
                if (num % 2 == 0) {
                    list1.setText(list1.getText() + " " + num);
                } else {
                    list2.setText(list2.getText() + " " + num);
                }
            }
        });

        frame.add(submit);
        frame.setVisible(true);
    }
}
```

}

---

## 12.3 Output

## 13 Traffic Light Simulation

### 13.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 13.2 Code

---

```
package org.projects.prog13;
import java.awt.Color;
import java.awt.GridLayout;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;

import javax.swing.*;

//13. Write a java program to simulate a traffic light. The program lets the user
//select one of the three lights: red, yellow, or green. On selecting a button,
//an appropriate message with "Stop", "Ready" or "Go" should appear above the
//buttons selected color.

public class Traffic {
    public static void main(String[] args) {
        JFrame frame = new JFrame("Traffic");
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setLayout(new GridLayout(2, 1));
        frame.setSize(300, 130);

        JLabel sign = new JLabel();
        sign.setHorizontalAlignment(JLabel.CENTER);
        frame.add(sign);

        JPanel panel = new JPanel();
        panel.setLayout(new GridLayout(1, 3));

        JButton red = new JButton("STOP");
        red.setBackground(Color.RED);
        panel.add(red);

        JButton yellow = new JButton("READY");
        yellow.setBackground(Color.YELLOW);
        panel.add(yellow);

        JButton green = new JButton("GO");
        green.setBackground(Color.GREEN);
        panel.add(green);

        ActionListener on_click = new ActionListener() {
            public void actionPerformed(ActionEvent e) {
                sign.setText(((JButton) e.getSource()).getText());
            }
        };

        red.addActionListener(on_click);
        yellow.addActionListener(on_click);
        green.addActionListener(on_click);
    }
}
```

```
    frame.add(panel);  
    frame.setVisible(true);  
}  
}
```

---

### 13.3 Output

## 14 Applet In Java

### 14.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 14.2 Code

---

```
package org.projects.prog14;

import java.applet.*;
import java.awt.*;
import java.awt.event.*;

public class Tables extends Applet implements ActionListener {
    TextField t1;
    Button t2;
    String[] result;

    public void init() {
        t1 = new TextField(5);
        t2 = new Button("Submit");
        t2.addActionListener(this);

        result = new String[10];

        add(new Label("Enter a number"));
        add(t1);
        add(t2);
    }

    public void paint(Graphics g) {
        for (int i = 0; i < 10; i++) {
            g.drawString(result[i], 20, 40 + 20*i);
        }
    }

    public void actionPerformed(ActionEvent e) {
        int number = Integer.parseInt(t1.getText());
        for (int i = 1; i <= 10; i++) {
            result[i-1] = number + " x " + i + " = " + i * number;
        }
    }
}
```

---

### 14.3 Output

## 15 Savings Account

### 15.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 15.2 Code

---

```
package org.projects.prog15;

//15. Write a Java program to define Account class. Derive Saving_Account class
//from Account class. Define appropriate constructors for both classes. Define
//the following methods in the Saving_Account class:
// Display( ): To display account details including account number and balance in
// the account.
// Deposit( ): To deposit money in an account.

class Account {
    public String accName;
    public long accNumber;

    Account (String name, long number) {
        accName = name;
        accNumber = number;
    }
}

public class SavingsAccount extends Account {
    private int accBalance;

    SavingsAccount(String name, long number) {
        super(name, number);
        accBalance = 0;
    }

    public void display() {
        System.out.println("Account: " + accName);
        System.out.println("No: " + accNumber);
        System.out.println("Balance: " + accBalance);
    }

    public void deposit(int ammount) {
        accBalance += ammount;
    }

            }
        });
    }
}
```

```
    }  
  });  
  
  frame.add(submit);  
  frame.setVisible(true);  
}  
}
```

---

## 16.3 Output

## 17 Simple Interest

### 17.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 17.2 Code

---

```
package org.projects.prog17;

import java.applet.*;
import java.awt.*;
import java.awt.event.*;

public class Interest extends Applet implements ActionListener {
    TextField principle, rate, time;
    Label result;
    Button submit;

    public void init() {
        principle = new TextField("principle");
        rate = new TextField("rate%");
        time = new TextField("time");

        add(new Label("Fill the following"));
        add(principle);
        add(rate);
        add(time);

        submit = new Button("Submit");
        submit.addActionListener(this);
        add(submit);

        result = new Label();
        add(result);
    }

    public void actionPerformed(ActionEvent e) {
        int p = Integer.parseInt(principle.getText());
        int r = Integer.parseInt(rate.getText());
        int n = Integer.parseInt(time.getText());

        float si = (p * r * n)/100;
        result.setText("" + si);
    }
}
```

---

### 17.3 Output

## 18 Mouse Coordinates

### 18.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 18.2 Code

---

```
package org.projects.prog18;

        frame.setLayout(new GridLayout(3, 1));

        JPanel panel = new JPanel();
        panel.setLayout(new GridLayout(1, 2));
        panel.add(new JLabel("Enter Name"));

        JTextField name = new JTextField();
        panel.add(name);

        frame.add(panel);

        JButton submit = new JButton("Submit");
        JLabel hello = new JLabel();

        submit.addActionListener(new ActionListener() {
            public void actionPerformed(ActionEvent e) {
                hello.setText("Hello " + name.getText() + "!!");
            }
        });
        frame.add(submit);

        frame.add(hello);

        frame.setVisible(true);
    }
}
```

---

### 20.3 Output

## 21 Priority Threads

### 21.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 21.2 Code

---

```
package org.projects.prog21;

public class Threading {
    public static Runnable simple_runnable = new Runnable() {
        public void run() {
            String name = Thread.currentThread().getName();
            for (int i = 0; i < 10; i++) {
                System.out.println(name + " " + i);
            }
        }
    };

    public static void main (String args[]) {
        Thread th0 = new Thread(simple_runnable), th1 = new Thread(simple_runnable);

        th0.setPriority(Thread.MIN_PRIORITY);
        th1.setPriority(Thread.MAX_PRIORITY);

        th0.start();
        th1.start();
    }
}
```

---

### 21.3 Output

## 22 Employee Details

### 22.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

### 22.2 Code

---

```
package org.projects.prog22;
import java.sql.*;

public class Employee {
    public static void main(String args[]) {
        try {
            Class.forName("com.mysql.cj.jdbc.Driver");
            String username = "root", password = "coolPass", dbname = "dbone";
            Connection cn = DriverManager.getConnection(
                //"jdbc:mysql://localhost:3306/dbone", "root", "coolPass"
                "jdbc:mysql://localhost:3306/" + dbname, username, password
            );

            Statement state = cn.createStatement();
            ResultSet rs = state.executeQuery("select * from employee");

            while (rs.next()) {
                System.out.println("Id: " + rs.getInt(1));
                System.out.println("Name: " + rs.getString(2));
                System.out.println("Designation: " + rs.getString(3));
                System.out.println();
            }

            cn.close();
        } catch (Exception e) {}
    }
}
```
