1 Fibonacci Series

1.1 Aim

- Write a program to print the first n terms of the Fibonacci series

1.2 Code

```
package org.projects.prog1;

import java.util.Scanner;

public class Fibo {
    public static void main(String args[]) {
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number of terms");
        int limit = sc.nextInt();

        for (int i = 0; i < limit; i++) {
            System.out.print(fibo(i) + " ");
        }
    }

    static int fibo(int num) {
        return (num <= 1) ? num : fibo(num - 1) + fibo(num - 2);
    }
}
```

1.3 Output

2 Operations On Complex Numbers

2.1 Aim

- Write a program to create a class Complex to store complex numbers
- Complex has two fields to store the real and imaginary parts
- create static functions to add and multiply two complex numbers
- create a member function to display the complex number

2.2 Code

```
package org.projects.prog2;

public class Complex {
    int real, img;

    Complex(int real, int img) {
        this.real = real;
        this.img = img;
    }

    void display() {
        // some formatting to correctly display complex numbers
        String fmt =
            String.format("%d %c %di", real, (img > 0) ? '+' : '-', (img > 0) ? img : (-1
                ↪ * img));

        System.out.println(fmt);
    }

    static Complex add(Complex n1, Complex n2) {
        return new Complex(n1.real + n2.real, n1.img + n2.img);
    }

    static Complex multiply(Complex n1, Complex n2) {
        // alg
        // (a + bi) * (c + di)
        // = ac + adi + bci - bd =
        // = (ac - bd) + (ad + bc)i
        int real = n1.real * n2.real - (n1.img * n2.img);
        int img = (n1.real * n2.img) + (n1.img * n2.real);
        return new Complex(real, img);
    }

    static void cmp(Complex n1, Complex n2) {
        if (n1.real == n2.real && n1.img == n2.img) {
            System.out.println("The complex numbers are equal");
        } else {
            System.out.println("The complex numbers are not equal");
        }
    }

    public static void main(String args[]) {
        Complex c1 = new Complex(2, 3),
            c2 = new Complex(1, -2),
```

```
        c3 = add(c1, c2),
        c4 = multiply(c1, c2);

    c1.display();
    c2.display();
    c3.display();
    c4.display();

    cmp(c1, c2);
    cmp(c1, c1);
}
}
```

2.3 Output

3 Package Implementation

4 Class Implementation

4.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

4.2 Code

```
package org.projects.prog4;

public class Solid {
    int length, breadth, height;

    public Solid(int side) {
        length = side;
        breadth = side;
        height = side;
    }

    public Solid(int side, int height) {
        length = side;
        breadth = side;
        this.height = height;
    }

    public Solid(int length, int breadth, int height) {
        // its really easy to misspell length/breadth/height and get into odd errors
        // ideally during
        // exams I recommend shortening these to just l, b, h;
        this.length = length;
        this.breadth = breadth;
        this.height = height;
    }

    int area() {
        return 2 * ((length * breadth) + (breadth * height) + (height * length));
    }

    int volume() {
        return length * breadth * height;
    }

    void display() {
        System.out.println(String.format("Area: %d\nVolume: %d", area(), volume()));
    }

    public static void main(String args[]) {
        Solid cube = new Solid(2), sPrism = new Solid(2, 3), cuboid = new Solid(2, 3, 4);

        cube.display();
        sPrism.display();
        cuboid.display();
    }
}
```

```
// OUTPUT
/*
Area: 24
Volume: 8
Area: 32
Volume: 12
Area: 52
Volume: 24
*/
```

4.3 Output

5 Abstract Class Implementation

5.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

5.2 Code

```
package org.projects.prog5;

abstract class Figure {
    int length, breadth, height;

    abstract int area();

    void display() {
        // similiar to printf in C <stdio.h>
        System.out.printf(
            "Length: %d, Breadth: %d, Height: %d\nArea: %d\n", length, breadth, height,
            ↪ area());
    }
}

class Rectangle extends Figure {
    public Rectangle(int length, int breadth) {
        this.length = length;
        this.breadth = breadth;
        height = 0;
    }

    int area() {
        return length * breadth;
    }
}

class Triangle extends Figure {
    public Triangle(int breadth, int height) {
        this.breadth = breadth;
        this.height = height;
        length = 0;
    }

    int area() {
        return (breadth * height) / 2;
    }
}

public class Main {
    public static void main(String args[]) {
        Rectangle rec = new Rectangle(2, 3);
        Triangle tri = new Triangle(2, 4);

        rec.display();
        tri.display();
    }
}
```

```
// OUTPUT
/*
Length: 2, Breadth: 3, Height: 0
Area: 6
Length: 0, Breadth: 2, Height: 4
Area: 4
*/
```

5.3 Output

6 Inheritance In Java

6.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

6.2 Code

```
package org.projects.prog6;

class Rectangle {
    int length, breadth;

    public Rectangle(int length, int breadth) {
        this.length = length;
        this.breadth = breadth;
    }

    public int area() {
        return length * breadth;
    }
}

public class Box extends Rectangle {
    int height;

    public Box(int length, int breadth, int height) {
        super(length, breadth);
        this.height = height;
    }

    public int area() {
        return 2 * ((length * breadth) + (breadth * height) + (height * length));
    }

    public int volume() {
        return length * breadth * height;
    }

    public static void main(String args[]) {
        Rectangle rec = new Rectangle(2, 3);
        System.out.println("Area of Rectangle: " + rec.area());

        Box box = new Box(2, 3, 2);
        System.out.printf("Area of Box: %d\nVolume of Box: %d\n", box.area(),
            ↵ box.volume());
    }
}

// OUTPUT
/*
Area of Rectangle: 6
Area of Box: 32
Volume of Box: 12
*/
```

6.3 Output

7 Abstract Class With Inheritance

7.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

7.2 Code

```
package org.projects.prog7;

// this program does not require a main function
// since abstract classes can not be instantiated
public abstract class Account {
    String holder_name;
    long number;
    float balance;

    Account(String name, long num) {
        balance = 0;
        holder_name = name;
        number = num;
    }

    public void deposit(int amount) {
        balance += amount;
    }

    abstract void withdraw(int amount);
}
```

7.3 Output

8 Interface Implementation

8.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

8.2 Code

```
package org.projects.prog8;

class Employee {
    String name, code;
    public int basicPay;

    public Employee(String name, String code, int basicPay) {
        this.name = name;
        this.code = code;
        this.basicPay = basicPay;
    }

    public void display() {
        System.out.println("Name: " + name);
        System.out.println("Code: " + code);
        System.out.println("Basic Pay: " + basicPay);
    }
}

interface Salary {
    public abstract int calculate();
}

public class SallarySlip extends Employee implements Salary {
    int allowances, bonuses, deductions;

    public SallarySlip(
        String name, String code, int basicPay, int allowances, int bonuses, int
        ↪ deductions) {
        super(name, code, basicPay);
        this.allowances = allowances;
        this.bonuses = bonuses;
        this.deductions = deductions;
    }

    public int calculate() {
        return basicPay + allowances + bonuses - deductions;
    }

    public void display() {
        System.out.printf("Employee: %s\nCode: %s\nFinal Sallary: %d\n", name, code,
        ↪ calculate());
    }

    public static void main(String args[]) {
        SallarySlip slip = new SallarySlip("Bob Rose", "001", 10000, 4000, 3000, 1500);
        slip.display();
    }
}
```

```
}
```

```
// OUTPUT
```

```
/*
```

```
Employee: Bob Rose
```

```
Code: 001
```

```
Final Sallary: 15500
```

```
*/
```

8.3 Output

9 Multithreading In Java

9.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

9.2 Code

```
package org.projects.prog9;

public class Multithread {

    public static boolean even = false;
    public static boolean odd = false;
    public static boolean terminate = false;

    Thread t2 = new Thread(threadEven);
    Thread t3 = new Thread(threadOdd);

    t1.start();
    t2.start();
    t3.start();
}
}

```

9.3 Output

10 Exception Handling

10.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

10.2 Code

```
package org.projects.prog10;

public class Errors {
    static void division() throws InterruptedException {
        Thread.sleep(100);
        throw new ArithmeticException("division by zero");
    }

    public static void main(String args[]) {
        try {
            division();
        } catch (InterruptedException e) {
            System.out.println(e.getMessage());
        } catch (ArithmeticException e) {
            System.out.println(e.getMessage());
        } finally {
            System.out.println("Hello Mars!");
        }
    }
}

// output
/*
division by zero
Hello Mars!
*/
```

10.3 Output

11 Validation using Swing

11.1 Aim

- Create a Swing form with fields phone number and email ID
- Validate the fields

11.2 Code

```
package org.projects.prog11;

import java.awt.GridLayout;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;
import javax.swing.*;

public class Swing {
    public static void main(String[] args) {
        JFrame frame = new JFrame("Swing Example");
        frame.setLayout(new GridLayout(3, 2));
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setSize(300, 130);

        JTextField phoneNum = new JTextField();
        frame.add(new JLabel("Phone"));
        frame.add(phoneNum);

        JTextField email = new JTextField();
        frame.add(new JLabel("Email"));
        frame.add(email);

        JButton submit = new JButton("Submit");
        JLabel result = new JLabel();
        result.setHorizontalAlignment(JLabel.CENTER);

        submit.addActionListener(
            new ActionListener() {
                public void actionPerformed(ActionEvent e) {
                    String em = email.getText();

});  
  
frame.add(submit);  
frame.add(result);  
frame.setVisible(true);  
}  
}
```

11.3 Output

12 Text Field in Swing

12.1 Aim

- Create a Swing program that accepts a number
- if the number is even add it to list1
- else add it to list 2

12.2 Code

```
package org.projects.prog12;

import java.awt.GridLayout;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;
import javax.swing.*;

public class Swing {
    public static void main(String[] args) {
        JFrame frame = new JFrame("Swing Example");
        frame.setLayout(new GridLayout(4, 2));
        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
        frame.setSize(300, 130);

        JTextField number = new JTextField();
        frame.add(new JLabel("Number: "));
        frame.add(number);

        JLabel list1 = new JLabel();
        list1.setHorizontalAlignment(JLabel.CENTER);
